

1/72 DHC-6 Cockpit correction set or Matchbox / Revell kit

This set will improve the appearance and shape of the aircraft. The kit does have some issues with being consistent in material thickness of the plastic and I am sure that it is not entirely symmetrical, however only by very small amounts, however it does make it tricky to get a precise fit, and where to make the cut for the new section. Also do note that some blending will be required to fit the kit nose cones to the new forward fuselage.

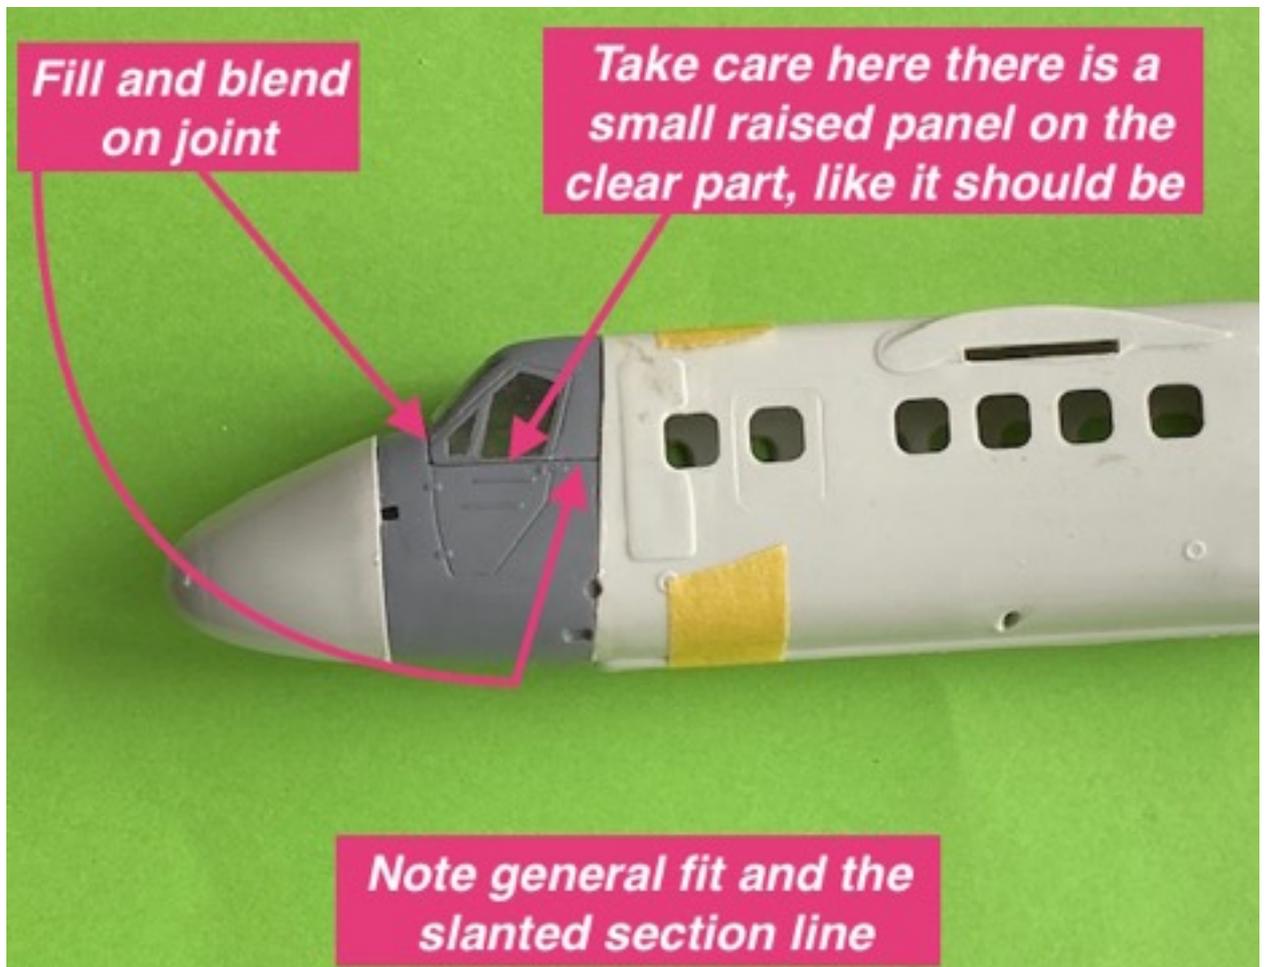

After cut, should look like this, note rear bulkhead support and cut follows a slight backwards slant

New bulkhead fitted, let it protrude to assist the fitting of the new forward fuselage section

Fill and blend on joint

Take care here there is a small raised panel on the clear part, like it should be

Note general fit and the slanted section line
